

Abstract

Vacuum and non-protein biota on the Moon and Mars, both civilizations of the technogenic type. Paradoxical photos indicating signs of the presence of a biological ecosystem. Articles in that turn the idea of the formation of the Moon upside down.

The

revolution began when the measured slope angle of large craters, obtained by the altimeter of an orbiting satellite, showed that the steepest slopes are at the largest craters, in this context, according to the meteorite version of their formation - dozens of the largest craters were formed quite recently! Since the steepness of the slopes reaches 65 degrees, then при frequent earthquakes, including catastrophic ones from the fall of the same large asteroids. Accordingly, the widespread collapses and landslides caused by this, in such conditions slopes with a large angle of inclination cannot exist for a long time, even one million years. Moreover, it is necessary to correctly count not the years, but the number of successive cataclysms that occurred in a given place.

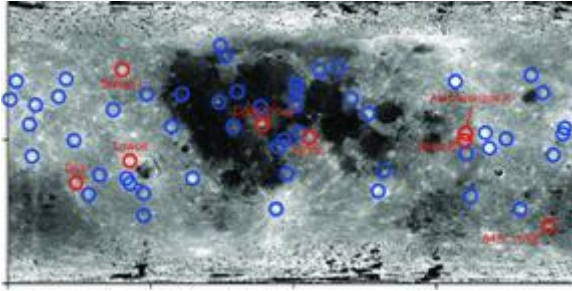

And if several nearby craters nevertheless have steep slopes, then these are not meteorite craters! Particularly noteworthy in this context are the poles of the Moon, literally pitted with craters located literally right next to each other, and in the AMS photo, terraces and steep cliffs are visible.... IM-2 Athena of IM + orbital Lunar.

While at the base of the cliffs there are not even significant accumulations, out of caution the authors of the publications set modest boundaries of 70–110 million years.

«Fig. 1: The locations of the 59 investigated craters with fresh morphologies and diameters larger than ~20 km.

"The locations of 59 studied lunar craters with fresh morphology and diameters greater than 20 km are shown. Craters with the same age as Copernicus are indicated by red circles."

<https://www.nature.com/articles/s41467-020-17115-6>

"for recent late Copernicus slope deformation processes, since its age is known (70–110 Ma)" «Fig. 1: The locations of the 59 investigated craters with fresh morphologies and diameters larger than ~20 km. "The locations of the 59 investigated lunar craters with fresh morphologies and diameters larger than ~20 km are shown. Craters with the same age as Copernicus are indicated by red circles."

<https://agupubs.onlinelibrary.wiley.com/doi/full/10.1029/2022JE007726>

But there is a paradox of what is observed with common sense (physics), let's consider the example of the "Daedalus" triad, it turns out that according to stratigraphy, first the smallest crater was formed, then the middle one, and only then a huge asteroid fell close to them, throwing out thousands of cubic kilometers of rock, and ... without any visible effect on the already existing satellite craters, as detailed in Chapter 3 "Atypical Craters of the Moon".

Moreover, on the Moon, judging by the fact that approximately 59 craters with a diameter of 20 to 180 kilometers are fresh, of which 13 even retained not only steep slopes but also a light ray system that has not yet disappeared after the impact, hence the meteorite version the formation of all of the above, all of them were formed not only recently but also miraculously without mutual overlap and action, as if they were the stems of the crown of plants, when subsequent shoots do not affect the shape and condition of the previous ones growing nearby!

Moreover, for the contrast of the light background of the rays to disappear, several centimeters of newly fallen rock are quite sufficient, whereas in fact, based on the available material from the ejection from the bowl of the 100-kilometer crater, this condition would have been met many times during the fall of rock from these very fresh 59 craters, but for some reason the color alignment did not occur...

- Reason?

Moreover, the lunar mass is 81 times less than the Earth's, so how did all these meteorites fall to the Moon, bypassing the Earth with its strong gravitational field? Again, the highest density of craters on the Moon's surface is in the polar regions, while most asteroid orbits are located in the ecliptic plane! Moreover, in contrast to the Moon, on Earth or Mars (whose orbit is much closer to the asteroid belt) there are practically no meteorite craters in the polar regions. Therefore, the questions asked are rhetorical, since from everything known, the logical one has long been suggested conclusion - lunar craters are not of meteorite origin but a product of the local ecosystem. That is, the Moon is inhabited and has its own complex ecosystem with many interconnected links in the food chain, including intelligent inhabitants who created the crater cities.

Let's list the facts: on the Moon, with the sunrise, a dusty atmosphere is formed, at the same time, seismometers installed by the Apollo mission recorded awakening, widespread shaking of the surface, in addition, from the side of large craters, seismometers recorded increasing flows of noise reminiscent of the hum of a working factory or subway.

Additionally, the delivered rock samples have signs of living organisms, and all the samples were cut with a knife, i.e. these are not breccias or simple rocks like fragments of fallen meteorites, but something similar to lumps of stuck dust, which the astronauts called - light, soft lumps of dust! In addition, almost immediately the samples, while in the vacuum

chamber, began to decompose, gradually falling apart and turning into a pile of fragments. in volume many times smaller than the original body.

The process is similar to the decomposition of dead terrestrial organisms; the composition of the gases released has not been published.

External signs are also similar to the signature of animals - skin, muzzle, anus, mimicry (difference in color and texture of the belly and back), large animals have teeth, the presence of traces and excrement, which the astronauts called "puddles" of frozen glass and "cow" dung,

and the surface of some excrements (dung) does not have traces of micrometeorites (fresh) or a low density of microcraters (recent) see Chapter 4,5,6.

Moreover, flat stones similar to unusual creatures have microcraters on both sides, which indicates a long time of being on the surface, i.e. possibly a long period of life or a long stay after death.

A simple explanation for the immobility of large rocky animal objects during the Apollo mission astronauts' inspection is most likely poisoning by gases from rocket engines, which are detrimental to vacuum life forms.

Mars

Signs of life in the Martian ecosystem: objects that look like dunes have the same shape regardless of the relief, whether in the mountains or on the plain, and dunes of different configurations, sometimes a very strange shape, move regardless of the relief areas, constantly and everywhere, regardless of the strength of the wind, but only in accordance with the season.

Moreover, the dunes contain several fractions: dust particles, sand grains and balls up to 0.6 mm in size, the movement of which at a normal wind speed of several meters per second is completely excluded, due to the understandable conditions of low density. Martian atmosphere. In addition, the surface of the dunes is covered with a kind of lumps of 4-5 mm in size, as for the shape similar to the earthly dunes, then in the case of Martian dunes, the shape of the dune is due to the need to optimize the ventilation of the entire surface.

In favor of the biota, it can be written down that the damage caused by the bucket or wheels of the Mars rovers quickly heals, and the track disappears without a trace even faster than in terrestrial conditions. In the photo, the dunes move as a "coherent unit" - a union of sand and dust, according to the terminology of NASA specialists.

There are also photos where the dunes leave a clearing after passing through thickets of stones, moving on their slopes even large boulders the size of a car. Moreover, we will pay attention. that the stones are local vegetation, which is indicated by the subsequent overgrowing of the clearing after some time, approximately in hundreds or thousands of Earth years.

The motley state of the Martian surface is physically impossible due to the dusty atmosphere without the constant participation of metabolic processes, the constant process of dust absorption, as well as the huge diversity of the form of Martian objects, which is quite compatible with the version of the presence of a complex ecosystem, similar in number of species to the Earth. Moreover, the technological stage of development, For example, in the photo of Spirit and Opportunity there are many light spots on individual units of the rovers, appearing after sunset. For more details, see Chapter 1,2 of the book, the content of which is constantly updated as new photos are received.

Epilogue

As a result, we formulate amazement at the amazing form of excision of the exclusive right to objective transmission of information, NASA's views have an excessive delicacy of approach, which are far from adequate to the situation that has arisen, when instead of targeted studies of the identified anomalies and a systemic assessment of those hitting the pupils video cameras crawling under the wheels of facts. the presence of an organized substance that attracts attention, for example, "the dunes move as a coherent unit, a union of sand and dust," which is impossible without the participation of the entire coherent Binomial Newton, i.e. the participation of the entire pyramid of the ecosystem.

Now we are all witnessing a simple fuss about an attempt to cover up an epochal discovery. As if if we wait a little longer, the inhabitants of the neighboring planet will disappear without a trace in the haze of a mirage, and in their place will appear sources of water and rescue bunkers filled with sand will be dug up, filled with folios covered with icons and symbols of the ever-worsening state of health, ecology and disappearing atmosphere, where it is becoming increasingly difficult to breathe... long-awaited signs – we have found them! Here on the walls are still warm shadows of their yesterday presence and in the starship's cabin there is an open map... the hangar and launch tower can still be repaired and we can fly further to new horizons our descendants will leave their genes everywhere even inside the black hole, see Chapter 4. But the text edition along the line of life is different, biota is widespread everywhere and the form of organized matter is significantly wider than the scope of our and your current ideas, as a randomly occurring phenomenon once and only on Earth, and without a preliminary exponential enumeration of options, but immediately as soon as they appeared conditions for the normal development of systemic connections that the norm for unlimited time of existence in the infinite Universe, the beginning of time and the emergence of space is a relic (rudiment) of the construction of the Three Elephants standing on the Turtle, invented from the theological views of being, since it is impossible to control unlimited space from one center. Now, after the discovery of the non-trivial nature of the ecosystem of the Moon and Mars, it is necessary to concentrate on preparing credentials and a draft agreement on the principles of peaceful coexistence for the benefit of all participants in the greatest event. Temporary problems with theology are obvious - destruction, bifurcation of the collective consciousness are inevitable, but to continue to ignore the facts means to aggravate the situation and become like the behavior of insects crawling on the body. The prospects are multi-valued - with the potential to buy and exchange theoretical and practical information and now unknown resources with incomprehensible properties, perhaps in the field of consciousness transformation (they for some reason they do not use radio waves, which means they have advanced into the area of non-electromagnetic radiation) and the consequences, the preliminary limits of which are set out in Chapter 0.7.

The first two photos were taken six months ago.

Perseverance Sol 1162 Jun 4 2024, "White Stone" in this area there are several signs of hidden activity, which can include any difference from the general color background, since without constantly operating processes, the presence of differences in color is impossible, due to dust precipitation.

Opportunity took the photo 10 years ago.

“White stump” was seen before, photos of Opportunity and Spirit.

Most likely, Percy found a similar phenomenon, but not the same.

Оппортьюнити Sol 04011

<http://www.midnightplanets.com/web/MERB/sol/04011.html>

<https://areo.info/mer/opportunity/4011/#11>

is confirmed by a rupture along a characteristic fracture, a fracture that coincides on both halves.

Number 11, the sliding of the stone from the stump-base is highlighted, apparently the place of birth and growing up, and temporary residence until the moment of maturation.

Number IV, V - the same unoccupied “stump-bases” are found near nearby boulders.

Number-111, the most interesting place, unknown form of contact between boulders-stones, possible insemination or aggression.

The stone demonstrates transformation and mobility - the “sliding” of the stone from the pedestal most likely means the mobility of the stones, according to the living version, stones

They are an elastic shell filled with sand-dust, the medium in which the metabolic process takes place. The rocks appear to move very slowly on our time scale.

The birth of crawling stones on a “stump”, but legally this act must be called the day of majority.

Such stones sliding from the stump were photographed by Spirit.

Spirit took the photo 17 years ago.

The conclusion is simple, more than plausible, all three groups of scientists and operators worked separately and did not conduct a joint analysis.

The blooming hill resembles a lawn with a huge assortment of vegetation and animals - grass, bushes, mushrooms, sheep, wolves, the diversity of species implies a difference in age - young growth, adult male and female individuals. Which automatically implies a time scale for the presence of a particular sample on the surface, as well as a difference in chemical composition and internal structure.
